SUMMARY

Full-Stack & AI Engineer who ships complete products, not just features. I single-handedly built and run SureCova, a live telemedicine platform serving 100+ users and processing real payments, from the NestJS backend and payments ledger to the React Native app and the Dockerised production server. At LemonWares I cut deployment time from 3–4 days to one day with CI/CD and have delivered 20+ client applications. I also design production AI systems with LangGraph, RAG and MCP, and having taught 20+ students, I explain every trade-off clearly to engineers, clients and leadership.

SKILLS

Languages: TypeScript, JavaScript, Python, PHP, SQL
Frontend: React, Next.js, Redux Toolkit, Tailwind CSS, HTML5, CSS3, Framer Motion
Mobile: React Native, Expo
Backend: Node.js, NestJS, Express.js, FastAPI, Laravel, REST APIs, WebSockets, Socket.io, BullMQ
Databases: PostgreSQL, MongoDB, Redis, Prisma, SQLAlchemy, Supabase, Firebase, Vector Databases
AI & LLM: LangGraph, CrewAI, OpenAI SDK, RAG, MCP (Model Context Protocol), Embeddings, Semantic Search, Prompt Engineering
Testing: Jest, Vitest
Cloud & DevOps: AWS (ECS Fargate, Lambda, RDS, S3, CloudFront, Bedrock), Terraform, Docker, Docker Compose, GitHub Actions (CI/CD), Linux VPS, nginx, Vercel, cPanel
Payments & Integrations: Paystack, Dodo Payments, Webhooks, Google Drive API, Cloudinary, Clerk, JWT, OAuth
Soft Skills: Technical Communication, Team Leadership, Mentoring, Client and Stakeholder Management, Problem Solving, Adaptability

EXPERIENCE

Full-Stack & AI Engineer | SureCova (Telemedicine)
Apr 2026 – Present

- Single-handedly architected and built SureCova's entire telemedicine platform for Nigeria and Ghana, covering the backend, payments, mobile app, website, admin console and infrastructure, and wrote about 93% of the codebase (340 of 366 commits).
- Built the complete payment infrastructure as a dedicated NestJS service: a double-entry ledger, Paystack integration, verified webhooks, automated reconciliation and doctor payouts, so every payment collected and paid out is accounted for.
- Built the patient and doctor mobile app in React Native (Expo) with appointment booking, real-time chat and push notifications, designed for a fast, dependable experience.
- Built the NestJS API with realtime messaging and background job workers on PostgreSQL, Redis and BullMQ, plus the Next.js website and admin console.
- Shipped public prescription verification so pharmacies can confirm a prescription is genuine.
- Deploy and manage production on a Linux VPS with Docker Compose, nginx and Let's Encrypt SSL, owning releases, uptime and security.
- Took the platform from idea to live production, now serving 100+ users and processing real payments.

Full-Stack Developer & Technical Lead | LemonWares (Digital Agency)
Jan 2026 – Present

- Cut deployment time from 3–4 days to one day by replacing manual cPanel uploads with automated CI/CD pipelines on GitHub Actions.
- Delivered 20+ custom web applications (and counting) for clients across industries such as e-commerce, education, healthcare and nonprofits, each tailored to the client's business.

- Moved client projects from rigid off-the-shelf builds to custom applications with admin dashboards, so clients update their own content and products without a developer.
- Redesigned and improved the UI/UX of client applications, raising quality and customer satisfaction.
- Worked directly with clients from discovery to launch: gathered requirements, wrote technical specs, demoed progress and turned feedback into releases.
- Built e-commerce features end to end, including product catalogues, Paystack checkout with secure webhook verification and order management.
- Lead architecture decisions and code reviews and set engineering standards across the team.

Full-Stack Developer & Web Development Instructor | Kode10x (Software Agency & Tech Academy)
2023 – 2024

- Built and maintained client and internal web applications with React, Node.js and Express.js, from feature development to performance optimisation.
- Trained and mentored 20+ students in HTML, CSS, JavaScript and React, taking beginners from zero to shipping their first applications.
- Secured backend APIs with JWT authentication and built responsive, mobile-first interfaces with Tailwind CSS.
- Reviewed student code and ran hands-on project sessions, sharpening my ability to explain why something works, not just that it works.

PROJECTS

B4Build – AI Software Build Planner
Next.js, FastAPI, LangGraph, PostgreSQL, Redis, AWS (ECS Fargate, RDS, CloudFront, WAF), Terraform, Docker, GitHub Actions

- Turns a plain-language product idea into a full build plan across 9 phases (architecture, cost, security, scaling and more), then a red-team agent challenges the plan before it is finalised.
- Five-node LangGraph state machine where follow-up questions re-run only the affected phases.
- Cut LLM cost by about 70% by running the phases on GPT-4o-mini and reserving GPT-4o for critique and synthesis.
- Defined all infrastructure in Terraform; chose ECS Fargate over Lambda because long streaming sessions exceed Lambda's timeout.

TimeWise – Multi-Tenant Staff Attendance SaaS
Next.js, TypeScript, MongoDB, CompreFace, AWS Rekognition, Docker

- Staff check in by ID, QR code, hands-free face recognition or a ZKTeco fingerprint device.
- Built liveness checks that stop a printed or on-screen photo from checking someone in, using a random head-turn challenge measured from face landmarks.
- Secured multi-tenancy with signed kiosk and biometric tokens, taking the tenant from the token and never from the request.
- Fixed lateness and reporting errors by running all date logic in each organisation's timezone; self-hosts with one Docker Compose command and automatic HTTPS.

DriveStack – Google Drive Storage Aggregator
NestJS, TypeScript, PostgreSQL, Prisma, Redis, BullMQ, Socket.io, Google Drive API

- Combines several Google Drive accounts into one storage pool with search, uploads, duplicate detection and moves between accounts.
- Streams files between accounts with no temporary files and live progress over WebSockets; moves are saved as phased operations that resume safely after a crash.
- Subscriptions with signature-verified, idempotent webhooks, a referral engine, and OAuth tokens encrypted with AES-256-GCM.

EDUCATION & TRAINING

- AI Engineering Bootcamp – Andela (2026)
- Full-Stack Software Engineering – Kode10x (2024)
- AI Engineering – Udemy (2026)
